Note: Years are harvest (e.g. 2019 refers to the 2018/19 cropping year) rather than calendar years. Data for 2019 are estimates.

Quantities of nitrogen, phosphate and potash used in the UK since 1966 are shown in Table B2.6. These data are based on BSFP findings and trade and sales data. They are compiled by the Agricultural Industries Confederation in conjunction with Defra using the methodology described in Section A2.5. They are the official figures for fertiliser usage.

Total nitrogen use in the UK increased from 590,000 tonnes in 1966 up to 1,674,000 tonnes in 1987 before declining gradually to 1,001,000 tonnes in 2008. The drop in 2009 was related to high fertiliser prices. Between 2010 and 2019 nitrogen use has remained relatively stable. From the peak in 1987, nitrogen use since has fallen by approximately 40%.

Phosphate use in the UK has fallen since the mid-1980s but since 2007 this decline has slowed, and total phosphate use has been more stable between 2010 and 2019, between 184,000 – 201,000 tonnes. However, use is still approximately half that compared to use between 1965 and 1985. The low use of 129,000 tonnes in 2009 was price related.

Potash use in the UK was highest in the mid-1980s through to 1999, after which there has been a more sustained decline. Potash use between 2010 and 2019 has been between 251,000 – 284,000 tonnes, which is around half that used at its peak. The low use of 208,000 tonnes in 2009 was price related.
